Many engineering applications that require high tensile strength normally use mild steel. This is because of the crystalline structure of mild steel that allows it to withstand high axial loads before fracture can occur. Aluminium however has found many uses in designs that require low density materials like in aerodynamics and some motor vehicles.

A unique solution must exist. The question as to whether or not a solution actually exists can be rather complex, and an answer can be sought for analytic PDEs by application of the Cauchy-Kowalewsky theorem [Cou-62, pp39-56]. The solution must be numerically stable if we are to be able to predict its evolution over time. If the physical system ...
