Power analysis is a form of side channel attack in which the attacker studies the power consumption of a cryptographic hardware device. These attacks rely on basic physical properties of the device: semiconductor devices are governed by the laws of physics, which dictate that changes in voltages within the device

If r is very small compared to x , then we observe that g will be very small compared to b , and it is reasonable to approximate eqs. (3) as $g \approx 0$ and $x \approx b$ (4)

Now, if $g=0$, then the real part of all of the Y-bus elements will also be zero, that is, $g=0 \Rightarrow G=0$. Applying this conclusion to the power flow equations of eq. (1):

$$P_N - \sum_{j \in N} |V_N| |V_j| (G_{kj} \cos \theta_{kj} + B_{kj} \sin \theta_{kj}) = 0$$
